

GP210 General Purpose Pump

THE GP210 Water Treatment System

The **GP210 General Purpose Pump** is a hand-operated suction type water pump. It can lift water approximately 25 feet (7.62 meters) at sea level from the water source to the pump at a rate of up to 17 US gallons (64.35 liters) per minute. Well suited for irrigation, the GP210 is available mounted on a stationary A-Frame, a mobile trailer, or as a stand-alone unit to be installed on your own stanchion.

An optional water filtration system, manufactured by [Hanish Water*](#), is available for producing safe drinking-water that meets or exceeds World Health Organization standards. This system filters any fresh water source down to 0.2 micron to virtually eliminate all contaminants including virus and bacteria.

GP210 & Hanish Water Filtration System

The GP210 Water Treatment System combines the GP210 and Hanish WaterGlen Filtration system. This complete system is the most powerful, hand-operated water filtration system in the world using a **4-stage filtration process**.

Stage one keeps debris from harming the pump by using a 78 micron screen housed in a protective cage that is easy to clean.

Stage two uses industrial grade back-washable filters containing Z-Pack, a third-generation media that removes suspended contaminants down to 3-5 microns.

Stage three uses a 1 micron replaceable filter.

Stage four uses the Hanish Bioguard/Carbon/Bioguard filter combination. This filters your water at the sub micron level to produce safe drinking-water.

A field test of the GP210 Water Treatment System performed on the Cuyahoga River in Ohio reduced the total coliform value of MPN 13,500/100ml to 0/100ml and the turbidity level from 9 to 0 NTU.

To obtain this system for disaster preparedness, security/military forces and developing nations, contact Gravitational Energy Corporation today.
